       This code was originally written for CS 231n at Stanford University
       (cs231n.stanford.edu). It has been modified in various areas for use in the
       ECE 239AS class at UCLA. This includes the descriptions of what code to
       implement as well as some slight potential changes in variable names to be
       consistent with class nomenclature. We thank Justin Johnson & Serena Yeung for
       permission to use this code. To see the original version, please visit
       cs231n.stanford.edu.
       def affine_forward(x, w, b):
         Computes the forward pass for an affine (fully-connected) layer.
         The input x has shape (N, d_1, \ldots, d_k) and contains a minibatch of N
         examples, where each example x[i] has shape (d_1, \ldots, d_k). We will
         reshape each input into a vector of dimension D = d 1 * ... * d k, and
         then transform it to an output vector of dimension M.
         Inputs:
         - x: A numpy array containing input data, of shape (N, d_1, ..., d_k)
         - w: A numpy array of weights, of shape (D, M)
         - b: A numpy array of biases, of shape (M,)
         Returns a tuple of:
         - out: output, of shape (N, M)
         - cache: (x, w, b)
         0.00
         # =============== #
         # YOUR CODE HERE:
           Calculate the output of the forward pass. Notice the dimensions
            of w are D x M, which is the transpose of what we did in earlier
         # assignments.
         # ----- #
         out = np.matmul(x.reshape(x.shape[0], -1), w) + b
         # ========== #
         # END YOUR CODE HERE
         # ------ #
         cache = (x, w, b)
         return out, cache
       def affine backward(dout, cache):
         Computes the backward pass for an affine layer.
         Inputs:
         - dout: Upstream derivative, of shape (N, M)
         - cache: Tuple of:
           - x: Input data, of shape (N, d 1, ... d k)
           - w: Weights, of shape (D, M)
         Returns a tuple of:
         - dx: Gradient with respect to x, of shape (N, d1, ..., d_k)
         - dw: Gradient with respect to w, of shape (D, M)
```

```
- db: Gradient with respect to b, of shape (M,)
 x, w, b = cache
 dx, dw, db = None, None, None
 # ------ #
 # YOUR CODE HERE:
  Calculate the gradients for the backward pass.
 # ------ #
 dx = np.matmul(dout, w.T).reshape(x.shape) # gradient of loss wrt x = W^T * upstre
 dw = np.matmul(x.reshape(x.shape[0], -1).T, dout) # gradient of loss wrt w = upstil
 db = np.sum(dout, axis=0) # gradient of loss wrt b = upstream, summing wrt datapo:
 # END YOUR CODE HERE
 # ============== #
 return dx, dw, db
def relu forward(x):
 Computes the forward pass for a layer of rectified linear units (ReLUs).
 Input:
 - x: Inputs, of any shape
 Returns a tuple of:
 - out: Output, of the same shape as x
 # YOUR CODE HERE:
   Implement the ReLU forward pass.
 # ----- #
 out = np.maximum(0, x)
 # ============ #
 # END YOUR CODE HERE
 # ============== #
 cache = x
 return out, cache
def relu backward(dout, cache):
 Computes the backward pass for a layer of rectified linear units (ReLUs).
 Input:
 - dout: Upstream derivatives, of any shape
 - cache: Input x, of same shape as dout
 Returns:
 - dx: Gradient with respect to x
 x = cache
 # YOUR CODE HERE:
   Implement the ReLU backward pass
 # ------ #
 dx = (x > 0) * dout
 # ----- #
 # END YOUR CODE HERE
```

```
return dx
def svm loss(x, y):
 Computes the loss and gradient using for multiclass SVM classification.
 Inputs:
 - x: Input data, of shape (N, C) where x[i, j] is the score for the jth class
   for the ith input.
 - y: Vector of labels, of shape (N,) where y[i] is the label for x[i] and
   0 \le y[i] \le C
 Returns a tuple of:
 - loss: Scalar giving the loss
  - dx: Gradient of the loss with respect to x
 N = x.shape[0]
 correct class scores = x[np.arange(N), y]
 margins = np.maximum(0, x - correct_class_scores[:, np.newaxis] + 1.0)
